INTRODUCTION

In cooperation with the State dairy extension services, the Bureau of Dairy Industry has recently begun an intensive and concerted effort to "prove" as fully as possible the breeding value of all sires used in dairy herd-improvement association herds, and to make the information available in such a way that it will be of the greatest benefit to the dairy industry.

This publication contains the names of the 1,553 sires whose "proved-sire" records were tabulated by the Division of Dairy Herd Improvement Investigations between November 1, 1935, and April 1, 1937. It is expected that a similar list of proved sires will be published annually hereafter, and will include all association sires whose records were tabulated during the preceding 12 months.

While knowledge of a sire's breeding value is of particular importance to the owner of the herd in which he is being used, the information often will be of interest and value to other dairymen whose herds carry related blood lines. Publication of a list of the sires proved each year in these associations is also expected to furnish current information that will be helpful to all dairymen in selecting promising sires to head their herds.

The names of the owners of the listed sires are omitted purposely. Dairymen wishing more information about a listed sire than is contained in the brief summary should address the request to the State dairy extension specialist in the State in which the sire was proved. The addresses of these officials are on page 5.

MEANING OF THE TERM "PROVED SIRE"

In dairy herd-improvement association work a sire is termed a proved sire when the production records of at least five of his unselected daughters have been compared with the production records of their dams. Such comparisons may show that a sire has transmitted high-, medium-, or low-producing ability to his daughters. To say that a sire is a "proved-sire", therefore, does not necessarily mean that the sire is a valuable sire; it merely means that the production records of five or more of his unselected daughters and their dams have been compared on a uniform basis.

KIND OF RECORDS USED IN DAM-AND-DAUGHTER COMPARISONS

All proved-sire records in this list were tabulated under the rules of the dairy herd-improvement association proved-sire program. Under the rules of this program, all production records of daughters and dams used in the tabulation consist of the first 305 days' production of the lactation period. Records of cows under 6 or over 7 years of age are converted to a 6-year-old basis by using age-conversion factors developed by the Division of Dairy Herd Improvement Investigations, from records of association cows. Records of cows milked three or four times a day during any part of the 305-day lactation period are reduced to a twice-a-day milking basis; the record being reduced 0.0655 percent for each day the cow was milked three times a day, and 0.1148 percent for each day the cow was milked four times a day. When more than one lactation record is available each record is standardized according to the foregoing procedure and the average of all the standardized records is used to represent the producing capacity of the cow.

THE PROVED-SIRE RECORDS

The sires are listed by breeds, in alphabetical order. The information given for each sire may be better understood by studying the following proved-sire record:

ASCOTT TRIXY'S MILKMAN, IMP 39043 -----	14 daughters.....	31	7,814	4.0	311
Born, 12-8-26; proved, 2-24-37; dead; Vt.	5 daughters.....	10	7,844	4.0	315
Sire, Thorneroft Defiant Encore 39042.	5 dams.....	16	7,055	3.8	270
Dam, Ascott Trixy 113926.	Difference.....	(5-4-5)	+789	+ .2	+45

The Ayrshire sire Ascott Trixy's Milkman, Imp. 39043, as indicated in the second line was born December 8, 1926, and was proved February 24, 1937. He was dead when proved. In some records dashes (—) follow the date of proving, which indicates that no report was made as to whether or not the sire was alive or dead at the time of proving. The sire was proved in a herd in Vermont. The third and fourth lines give the name and number of the sire and dam of the proved sire.

Figures at the right show that the sire had 14 daughters with a total of 31 production records averaging 7,814 pounds of milk, testing 4.0 percent fat, and averaging 311 pounds of butterfat; that 5 of these daughters had 10 production records averaging 7,844 pounds of milk, testing 4.0 percent fat, and averaging 315 pounds of butterfat; and that the 5 dams of these daughters had 16 production records averaging 7,055 pounds of milk, testing 3.8 percent fat, and averaging 270 pounds of butterfat. A plus (+) or minus (−) sign indicates

whether the average production of the daughters is above or below that of the dams.

The three figures in parentheses (5-4-5) following the word "Difference" give a brief summary of the sire's record. The first figure is the number of daughters that equalled or excelled their dams in milk production, the second figure the number of daughters that equalled or excelled in butterfat test, and the third figure the number of daughters that equalled or excelled in butterfat production.

USING THE PROVED-SIRE RECORD

The proved-sire record as summarized here should be considered merely as an indication and not as conclusive evidence of the breeding value of the sire in question. If the difference between the average butterfat production of the dams and that of the daughters is less than 25 pounds, additional dam-and-daughter comparisons may conceivably reverse the results of the summary.

In general, however, a proved-sire record that includes a large number of dam-and-daughter comparisons can be considered as better evidence of the sire's breeding value than a record that includes only the minimum number of comparisons permitted in sire-proving work. Also, the greater the number of lactation records included in the average record of each dam and daughter the more dependable the proved-sire record.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.

SONS OF PROVED SIRES

Although many of the sires listed were dead when proved, they may have living sons available for breeding purposes. It has been demonstrated that sons of good proved sires, that is, sires that have transmitted high-producing capacity to a large percentage of their daughters can be used with greater assurance of success than sons of sires that have not been proved. Further assurance of success with sons of proved sires is indicated if the sons are out of high-producing dams and if they have high-producing full sisters.

TABLE 1.—*Number of proved sires listed by States and by breed*
